Genetic proof points to that this process began dozens of thousands of years ago, likely primarily involving hunting near human settlements. Over time, a mechanism of natural choice favored wolves with a higher tolerance for human proximity, leading to a gradual shift in behavior and physical characteristics. This relationship between human requirements and canine qualities shaped the basis for the vast diversity of breeds we see currently. This collaboration is a strong example of how two separate species can influence each other's fates.

A5: Gradually accustom your Dog to being alone using short absences, providing comfort items such as toys or chews, and addressing underlying anxiety issues through training and possibly professional help.

The relationship between humans and Dogs continues to evolve. Progress in veterinary medicine are extending the lifespan of Dogs, while genetic research is providing a greater understanding into canine wellness and demeanor.
