At its core, Chimica focuses on the makeup, properties, and reactions of material. Everything around us, from the environment we respire to the nourishment we consume, is made up of atomic elements. Understanding the fundamental ideas of Chimica, such as the cyclical table, ionic composition, and chemical bonding, is crucial to appreciating the sophistication of the natural universe. We can use analogies to understand: think of atoms as LEGO bricks; different types of atoms are different colored bricks, and the way they connect determines the final structure – a simple house or a complex skyscraper. The properties of the finished structure (the molecule) depend on the type and arrangement of its constituent bricks (atoms).
